FLIP THE SWITCH · BEST BUSINESS WORKFLOW · NOV 4–7, 2026

AIRGRID

City drone response network · Northgate District (fictional)

The plan · solo build, Oct 29 → Nov 7

Cities lose drone programmes in coordination, not in the air.
AirGrid runs that coordination as a team in Switch:
kazum on watch, seven agents on the desks, a simulator that says no.

1 · The problem

Drone-first-responder programmes are real and growing: Chula Vista has flown 25,000+ calls, with the drone first on scene for 17,170 of them in about 97 seconds on average. Shenzhen runs pole-mounted docks along its roads. The aircraft are commodities now (DJI Dock 3 class: 54 min flight, 10 km radius, 27 min recharge).

What breaks programmes is coordination: launches that miss the two-minute window, batteries and landing slots managed by habit, no-fly lines remembered instead of enforced, privacy creep, and nobody able to say afterwards who approved which flight.

Failure	What AirGrid does	Friday Rush (computed, same seed vs baseline)
Slow launch	standing auto-launch policy, sim launches nearest capable drone	eyes-on **114 s** vs 17.0 min
Battery chaos	relief on station before the tired drone leaves; 25% hard floor; relay at 45%	27 flights, 0 reserve breaches, lowest landing 42%
Slot conflicts	slot booked before RTB, full/offline docks rerouted in code	D-09: P9 offline, P10 full → HUB-B
Airspace	red zone has no override; wind > 12 m/s grounds sectors	airfield route refused, hold + reacquire on the far side
Privacy	track needs scope + expiry; face ID doesn't exist; recording only in geofence	face-recognition push refused mid-chase; suspect detained anyway
No record	every launch, approval, refusal → Switch Decisions	shift reconstructs from one panel

Why Switch is central

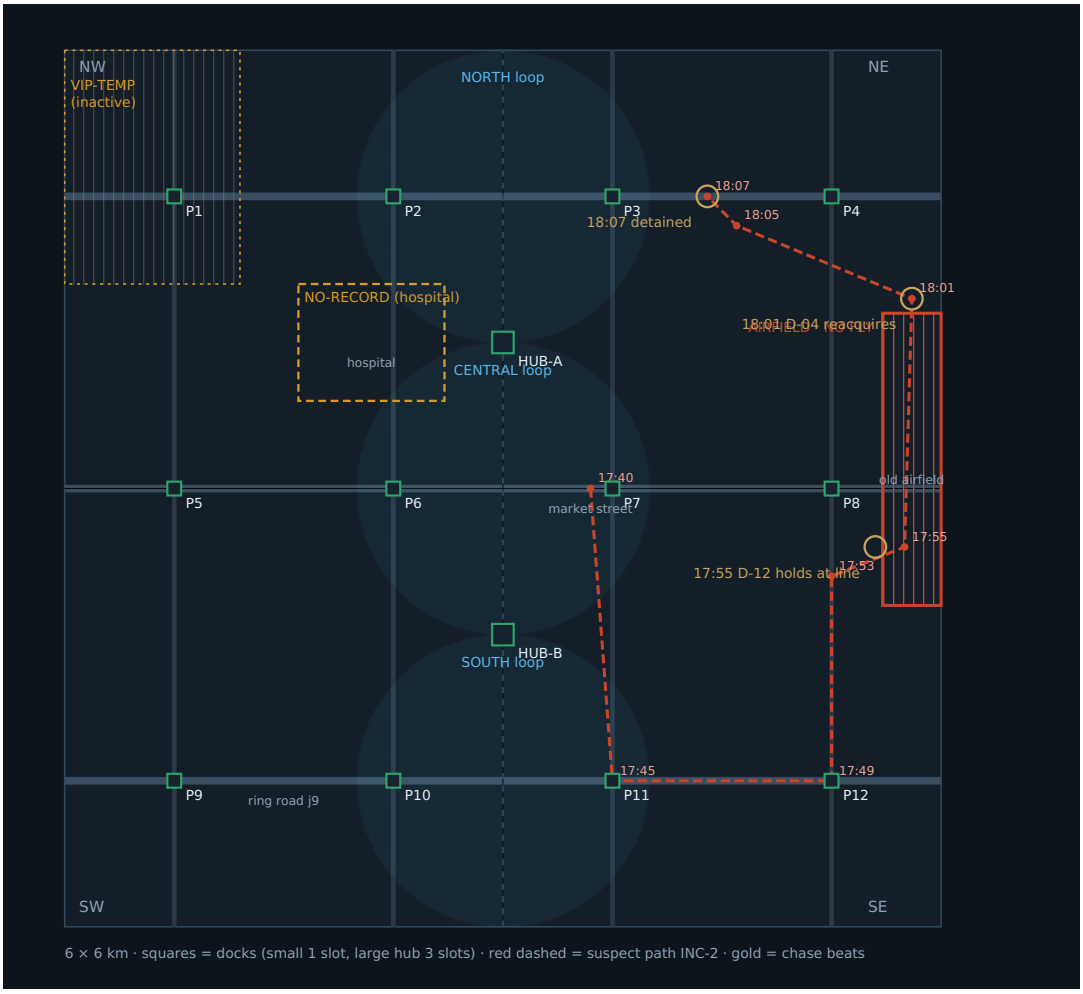

The rooms are the ops centre. Agents hold desks, hand work to each other in the open, and the Decisions panel is the flight-authorisation log real programmes are required to keep. Rules tabs carry the posted law. Remove Switch and you get seven CLI sessions with no shared picture and nobody able to approve a chase.

2 · The system

```
Simulator (system of record, does the time-critical work)
  auto-launch · rotation · backfill · slot booking · relay · safety RTB · weather · rules
       | SSE                          ▲ validated actions (airgrid CLI, role tokens)
       ▼                              |
World Bot (plain code) ──► Switch rooms ◄──► 7 agents (outside the repo)
  alerts, approval cards,     #dispatch #fleet-hangar #airspace
  duty-pilot + radio lines    #incident-1 #incident-2 #field-units
  'approve A-0003' ─► sim     #privacy-log #shift-report
       |
Dashboard (HTML + SVG + SSE): live map, fleet board, KPI strip, privacy ticker, scorecard
```

The split that makes it work: anything that must happen in seconds is sim code. Agents narrate, propose, refuse, and talk to the human. An LLM is never in the critical path of a launch.

The district

14 drones, 12 pole docks + 2 hubs = 18 slots, three patrol loops, max 4 drones per pilot (kazum + two simulated duty pilots, no auto pool).

3 · Your team (solo)

Hat	kazum does
Watch Commander	approves the standing policy, the track (scope + expiry), loudspeaker, zones
Remote Pilot	takes manual control of D-04 at 18:03
Field Officer	asks for eyes, and pushes the bad requests on camera

Agent	Room	Job
Dispatch KEY	#dispatch	alerts → incidents, launches, eyes-on, Decisions trail
Fleet & Energy	#fleet-hangar	rotations, slots, readiness
Airspace & Safety	#airspace	routes, zones, weather
Incident Intel	#incident-*	SITREPs, evidence (no identities)
Relay / Tracking	#incident-*	track + handoffs
Privacy & Compliance KEY	#privacy-log	refusals, authorisations, recording audit
Comms / Liaison	#field-units, #shift-report	ground units, advisories, shift report

All seven run in your Switch Console on Claude Code (Codex optional for Fleet/Airspace/Relay). Team later = change `config/humans.yaml`.

4 · The demo: Friday Rush

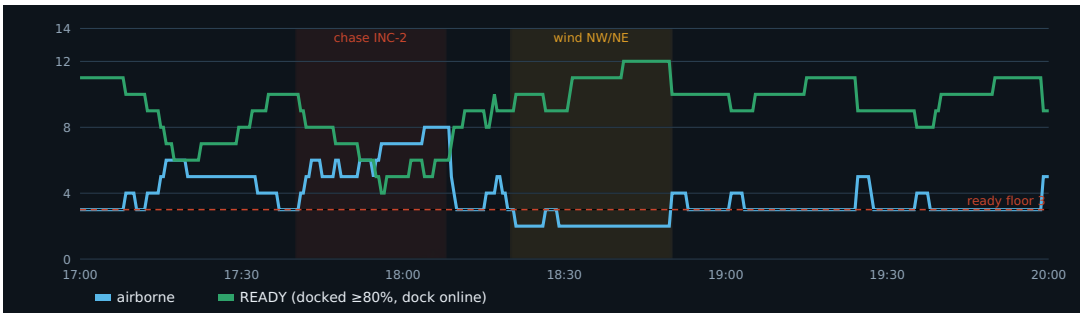

Time	Beat
17:00	brief, standing policy approved, three patrols up
17:12	accident at Ring Road J9 → D-09 auto-launch → eyes-on 17:13:54 (114 s)
17:21	Intel: minor injuries → patrol car released early
17:35	D-09 home dock offline, next full → HUB-B
17:40	robbery, scooter → track needs approval → approved 17:41, 30 min scope
17:41	D-13 diverted at 60%, D-07 backfills central same minute
17:48	handoff D-13 → D-12, gap 0 s
17:52	"run face recognition on the crowd" → PRIVACY_POLICY
17:55	"route through the airfield" → NO_FLY_ZONE; hold at the line, corridors north and south
18:01	D-04 reacquires north of the airfield
18:04	5th drone for kazum → PILOT_SATURATED → duty pilot DP-2
18:07	detained · 18:08 "keep it up just in case" → MISSION_EXPIRED
18:20	wind 13 m/s, north grounded 30 min, gap shown honestly
20:00	scorecard

Chase batteries

D-13 is diverted at 60%, hands off at 43%. D-12 holds at the red line. Nothing comes close to the 25% floor.

Fleet over the shift

	AirGrid	Baseline (patrol cars + 1 van team)
Accident eyes-on	114 s	17.0 min
Robbery	detained 18:07	drone up 18:08, suspect lost
Units released early	1	0
Junction coverage	93.9%	~9%
Reserve breaches / red-zone entries	0 / 0	—

5 · Timeline

Day	Claude Code	Dashboard lane	You
Thu Oct 29	—	—	setup, unzip, validators
Fri Oct 30	01 bootstrap, start 02	—	Discord rooms, Switch Console, hello-agent
Sat Oct 31	02 sim core = checker → **G1**	map + fleet board from replay	Decisions/Tasks probe
Sun Nov 1	03 rules + actions	SSE + KPI strip	review G1
Mon Nov 2	04 incidents, units, triggers, baseline	incident panel, ticker	—
Tue Nov 3	05 CLI + World Bot (FakeRoom)	triggers + scorecard	FakeRoom dry run
Wed Nov 4	06 agents headless → **G2**	polish	sign G2
Thu Nov 5	08 Switch live → **G3**	—	Console setup, live checks
Fri Nov 6	09 README, scripts	final visual pass	2 rehearsals
Sat Nov 7	09 final → **G4**	—	record, blog, submit by ~6 PM

Cut order: Codex → unscripted segment → footage release → advisories/retiming → Tasks panel → dashboard polish → merge #incident-2. **Never cut:** eyes-on, track approval, 0-gap handoff, the privacy refusal, the airfield hold, PILOT_SATURATED, MISSION_EXPIRED, Decisions, scorecard.

6 · How Claude Code builds it

Unzip the kit into your repo, run the two validators, paste the master prompt. Claude writes a build plan, waits for your "go", then runs one phase per session with six builder subagents (sim, integration, dashboard, agent author, tests, reviewer) and stops at every gate.

Phase	Builds	Gate
01	skeleton	tests green
02	sim core, policies, clock	GATE G1: golden run = checker
03	rules, actions, privacy, approvals	every code tested
04	incidents, units, triggers, baseline, KPIs	managed beats baseline
05	airgrid CLI + World Bot (FakeRoom)	/demo-run
06	7 agents, headless	GATE G2: 3 green runs
07	dashboard (parallel from Oct 31)	screenshots
08	live in Switch	GATE G3
09	ship	GATE G4

Still open

- How Switch Decisions/Tasks entries get created (probe Oct 31; manual fallback ready).
- Switch custom-client details for the World Bot (docs MCP).
- Video length cap (script is 5:00, trim possible).
